**Mālama** ................................................................. Music: Michael-Thomas Foumai

Art: Selections from the Student Art Contest | Edit: Pawel Nuckowski

---

**ʻIʻiwi**
- Found on Hawai'i, Maui, and Kaua'i, possibly Moloka'i and O'ahu.
- ʻIʻiwi use their curved beaks to extract nectar from native flowers.
- Their brilliant red feathers were used in Hawaiian featherwork, most notably in the capes of royalty.
- ʻIʻiwi are threatened by habitat destruction, diseases, and introduced predators like rats.

**Palila**
- Only found in the dry forests of Hawai'i island.
- Palila have a close relationship with the māmane tree.
- Their large parrot-like bills are perfect for cracking open māmane seed pods.
- They also eat naio berries and insects.
- Māmane seeds are actually poisonous, but the palila have developed a resistance to its toxins.

**ʻElepaio**
- Three ʻelepaio species are found on Kaua'i, O'ahu, and Hawai'i.
- ʻElepaio love to eat insects in old koa trees. Hawaiians recognized this behavior, and wise canoe makers would never use trees that ʻelepaio ate from.
- ʻElepaio are among the most celebrated songbirds in the islands.
- These birds have shown impressive resistance to both disease and introduced predators.

**Kiwikiu**
- Kiwikiu is only found on the island of Maui.
- These are large honeycreepers with heavy parrot-like bills.
- The kiwikiu uses its bill to strip bark off of trees in search of its favorite foods: moth caterpillars and beetle larvae.
- For years this species was called the Maui Parrotbill because the original Hawaiian name was lost. It wasn't until 2010 when the bird was given the name “kiwikiu” in an official naming ceremony.

**ʻApapane**
- Found on all of the Main Hawaiian Islands.
- Feeds on nectar from the ʻōhiʻa tree, but will sometimes eat insects.
- One of Hawai'i's most versatile native songbirds, the ʻapapane has many different songs and calls.
- ʻApapane are important pollinators of ʻōhiʻa.
- ʻApapane feathers were used to make feather cloaks, lei, and helmets.

**ʻAkikiki**
- The ʻakikiki is endemic to Kauaʻi.
- The song of the ʻakikiki is a series of high-pitch chirps.
- Forages in tree trunks for insects.
- Nests only in the tops of ʻohia trees.
- Scientists estimate that there are less than 500 ʻakikiki left in the wild.
- The remaining ʻakikiki are restricted to the misty mountain forests of Kauaʻi.

**Akohekohe**
- One of the largest Hawaiian honeycreepers.
- Only found on the windward side of Haleakalā on Maui.
- Glossy black feathers with orange streaks.
- The white crest of the ʻakohekohe helps to pollinate the plants it visits for nectar!
- Has a variety of calls, but the most common is a repeating whee-o whee-o.
- The ʻakohekohe is an endangered species, with less than 4000 birds in the wild.
